Performance tools

■ Objective:

- Identify performance problems and help optimize application

■ Phases

- Data acquisition
- Processing
 - ✓ Compaction
 - ✓ Summarization: Statistics
- Presentation
 - ✓ Textual
 - ✓ Graphical
 - ✓ Esoteric ...

Jesús Labarta, SC,2002

Performance tools

■ Data acquisition:

- Insert probes into the running program

■ Basic approaches

- Statistical profilers
 - ✓ Based on sampling program activity: PC, call stack.
 - ✓ Interrupt driven: correlated or not with program activity
 - ✓ Need to project samples to total program behavior
- Tracing
 - ✓ Instrument every occurrence of relevant events
 - ✓ Instrumentation library / Dynamic instrumentation

Jesus Labarta, SC, 2002

Performance tools

■ Information processing

- A lot of samples are obtained
- Some type of processing may be needed before presenting the information to the user

■ Basic approaches

- Inline processing
 - ✓ Data processing is performed during the program run.
 - ✓ A small output (statistics) is generated by the instrumentation tool
- Off line (post mortem)
 - ✓ All data is emitted to a file
 - ✓ A tool post-processes the data
- Different levels of intermediate approaches are possible

Jesus Labarta, SC, 2002

Performance tools

■ Information processing basic approaches

- Inline processing
 - ✓ Perturbation: Processing overhead
 - ✓ Simple, predefined set of statistics
 - ✓ No control of details: need to believe in way of accounting
 - ✓ No information on time distributions,
- Off line (post mortem)
 - ✓ Perturbation: Buffering - I/O overhead
 - ✓ File size and management
 - ✓ All data is there: can the analysis tool extract it? Do we know what to look for?

Jesus Labarta, SC,2002

Performance tools

■ Perturbation:

- Probe effect
- f (granularity, overhead)
 - ✓ Granularity
 - Program
 - What to instrument
 - ✓ Overhead
 - Control flow
 - Time measurement
 - Inline processing
 - Storage to buffer
 - » Written to disk when full

Jesus Labarta, SC,2002

Profiling @ SGI

■ Instrumentation program

- Ssrn: sampling every
 - ✓ Application time (user+system)
 - ✓ User time
 - ✓ Number of instructions, cache misses,...

■ Post processing / presentation

- Cvperf: graphical
- Prof: textual

CEPBA tools: Challenge

What can we say
about an unknown application/system
without looking at the source code
in short time?

Jesus Labarta, SC,2002

CEPBA tools: Thesis

“A **single instrumented run**
captures a **lot of information**
that is essentially **thrown away**
in current parallel programming practice”

Jesus Labarta, SC,2002

CEPBA-Tools

■ Philosophy: Flexibility, insight !!!

- Performance analysis $\equiv$ search on a huge and fuzzy space
 - ✓ Be equipped with flexible tools ...
 - No semantics in the tool
 - ✓ ...supporting quantitative analysis ...
 - ✓ and be ready for surprises

■ Core tools

- Paraver
- Dimemas

... available through
<http://www.cepba.upc.es/tools>

Jesus Labarta, SC,2002

Index

Jesus Labarta, SC,2002

Analysis modules: 2D

■ 1 column per control window value

- User Function

■ Per thread statistics

- # times function is called
- Per function execution profile
- average function call duration

Jesus Labarta, SC,2002

Analysis modules: 2D

■ 1 column per control window value

- Range of Durations

■ Per thread statistics

- Histogram of durations
- Cumulative time at each duration

Jesus Labarta, SC,2002

Analysis modules: 2D

■ Statistics on data window accumulate on column specified by control window

■ Per thread statistics

- Average of data window
- Integral of data window
- #data window value changes
- ...

Jesus Labarta, SC,2002

Analysis modules: 2D

Jesus Labarta, SC,2002

Complex?

- **Window configuration files: Capture views**
 - Expert knowledge on how to compute performance index
 - Knowledge on “reasonable” values (scales)
 - Specific time and scales to expose behavior
- **What is useful for**
 - Performance analysis by non expert
 - Training
 - Checkpointing of studies
 - Cooperative work
 - Bug reporting

Jesus Labarta, SC,2002

Configuration files: Directory tree

■ OMPItrace

- General
 - ✓ State as is, user functions, user function distribution
- OpenMP
 - ✓ Parallel functions, parallel function distribution,
- MPI
 - ✓ MPI call profile, MPI call distribution, message size, send BW, ...
- Counters
 - ✓ Program
 - Memory ops mix, Memory access direction, ...
 - ✓ Architecture
 - L2 miss ratio, ...
 - ✓ Performance
 - IPC, cycles per ms, MIPS, Memory BW, processor BW, ...

Jesus Labarta, SC,2002

Methodology

■ Where to look?

- Potentially very complex
- Intricate relations between huge number of factors
- Microscopic phenomena may have macroscopic effects
- Delayed effects

■ What to look for?

■ How?

Jesus Labarta, SC,2002

Methodology

■ The Optimization process

Jesus Labarta, SC,2002

Methodology: a wish

- A set of performance indices to look at
- Expected observations. Good and bad references
- A mechanism to drive the search process based on precious observations
 - Sequence
 - tree
- Conclusion: exit path when performance problem identified
- Reality: still a wish

Jesus Labarta, SC,2002

Methodology and Paraver

- Paraver is not a methodology
- Paraver and the configuration files support the development of methodologies appropriate for families of applications or environments

Jesus Labarta, SC,2002

Methodology: Reference

- What to trace? For how long?
- What is the application structure?

- Objective

- Representative duration
 - ✓ Relevant part: not initialization
 - ✓ Sufficient periods
- Representative events
 - ✓ Routines
 - ✓ Variables
- Small trace

Jesus Labarta, SC,2002

Analysis methodology

Jesus Labarta, SC,2002

Instrumentation

■ Probes

- Timing
- Hardware counters
 - ✓ Portable: PAPI (<http://icl.utk.edu/projects/papi>)
 - ✓ Vendor specific: PMAPI, ...

■ Insertion of probes

- Dynamic
 - ✓ DIttools (<http://personals.ac.upc.es/alberts/fpc.html>)
 - ✓ DPCL (<http://oss.software.ibm.com/developerworks/opensource/dpcl>)
 - IBM, Linux?
 - Dyninst based (<http://www.dyninst.org/>)
- Static:
 - ✓ PMPI

Overhead

■ Application elapsed time w/o instrumentation

- Similar → user happy
- Very different → the application has a problem
- Very different → still very useful
 - ✓ I.e.: Hardware counts

■ Learn how to live with it

- Don't relax try to extract as much information as possible

■ Overhead of tracing in Linux

- No hardware counters: 1-2 μ s
- Hardware counters:
 - ✓ 1 Process: 6-7 μ s
 - ✓ 4 Processes SMP: 16-19 μ s (PAPI)

Jesus Labarta, SC,2002

Structure

Demand Driven evaluation

Jesus Labarta, SC,2002

Semantic value

■ $S = f(t)$

- Piecewise constant function of time represented by one window
- Depends on the filtered subtrace: subset of records of the trace left through by the filter. Each window may see a different subtrace.
- The semantic value at time t may depend on records with time stamps potentially very far apart from t .

Jesus Labarta, SC,2002

Filter module

■ What : restrict records that pass to the semantic module

- Events
 - ✓ by type
 - ✓ by value
- Communications
 - ✓ by tag
 - ✓ by size
 - ✓ by source / destination
 - ✓ logical / physical

■ What for

- Reduce amount of information to display
- Feed properly the semantic module

Jesus Labarta, SC,2002

Semantic module

■ Angle:

- Process model
 - ✓ Thread, task, application, workload
- Resource model
 - ✓ CPU, node, system

Jesus Labarta, SC,2002

Semantic module: process model view

- Semantic value: $f(t)$
- $f = f_{comp2} \circ f_{comp1} \circ f_{Application} \circ f_{task} \circ f_{thread}$
- Semantic functions
 - ✓ f_{comp2}, f_{comp1} : sign, mod, div, in range, select range
 - ✓ $f_{Application}$: add, average, max, select
 - ✓ f_{task} : add, average, max, select
 - ✓ f_{thread} : in state, useful, given state, last event value, next event value, average next event value, interval between events, ...

Jesus Labarta, SC,2002

Semantic module: resource view

- $f_{\text{resource}} = f_{\text{System}} \circ f_{\text{Node}} \circ f_{\text{CPU}} \circ f_{\text{thread}}$
- Semantic functions
 - ✓ f_{System} : add, average, max, select
 - ✓ f_{Node} : add, average, max, select
 - ✓ f_{CPU} : select
 - ✓ f_{thread} : in state, useful, given state, next event value, thread_id

Jesus Labarta, SC,2002

Semantic module

Derived windows

- Point wise operation
 - ✓ $f = a * f_1 <op> B * f_2$
 - ✓ $<op>$: +, -, *, /, ...

L2 Line Loads

Loads

Stores

Mem Ops

L2 miss ratio

Jesus Labarta, SC,2002

Semantic module

- **Derived windows**

- Point wise operation
 - ✓ $f = a * f_1 \langle op \rangle \beta * f_2$
 - ✓ $\langle op \rangle : +, -, *, /, \dots$

Interval between MPI events

In MPI call

MPI call duration

Jesus Labarta, SC,2002

Semantic module: Examples

- Thread function: State as is

- Useful for

- Global thread activity: computing, idle, fork/join, waiting,.....

Jesus Labarta, SC,2002

Semantic module: Examples

■ Filter: type == 2

Thread function: Last event value

■ Useful for

- In parallel region
- Mutual exclusion
- Variable values: iteration,....

Jesus Labarta, SC,2002

Semantic module: Examples

■ Filter: type == 4

Thread function: Next event value

■ Useful for

- Hwc events (TLB, L1 misses,...) within interval

Jesus Labarta, SC,2002

Semantic module: Examples

■ Filter: type == 4

Thread function: Average next event value

■ Useful for

- Hwc events (TLB, L1 misses,...) per time unit within interval

Jesus Labarta, SC,2002

Semantic module: Examples

■ Filter: type == USR_FCT

Thread function: Last event value

Compose: Stacked value

■ Useful for

- Routine

Jesus Labarta, SC,2002

Understanding applications/system

■ Effect of domain partition (sweep3d)

- 1 x 12
- 3 x 4
- 12 x 1

Jesus Labarta, SC,2002

Understanding applications/system

■ MPI calls analysis

- # MPI calls
- Average MPI call duration
- Percentage of time in MPI call (vs. Total time in MPI calls)

Jesus Labarta, SC,2002

Understanding applications/system

■ Isend duration histogram

- % Number of calls

Blue 30%
Green 3%

- Total time

Jesus Labarta, SC,2002

Understanding applications/system

■ Isend analysis

- Duration of Isend calls
- Zoom
- Select those with $1200\mu s < \text{duration} < 3000\mu s$
- Correlate to general view
 - ✓ Longer messages

Jesus Labarta, SC,2002

Dimemas

Jesus Labarta, SC,2002

Tracefile

- **Characterises application**
 - Sequence of resource demands for each task
 - Sequence of events: communication
- **Application model**

Jesus Labarta, SC,2002

Simulated Architecture

■ “Abstract” architecture

- Simple/general
 - ✓ network of SMPs
- Fast simulation
- **Key factors influencing performance**
- Abstract interconnect
 - ✓ Local/remote Latency/BW
 - ✓ Injection mechanism
 - #links
 - half/full duplex)
 - ✓ Bisection BW, contention

Jesus Labarta, SC,2002

Simulated Architecture

■ Collective communication model

- Fan-in / Fan-out
- Size of message
- Lin / log / const
- Barrier

Collective

Jesus Labarta, SC,2002

Qualitative validation

Dedicated machine

Shared environment

+ Dimemas

Jesus Labarta, SC,2002

Stability validation

■ On loaded system, 30 times

- trace & measure elapsed time
- predict time for dedicated system

Jesus Labarta, SC,2002

NAS Benchmarks

■ BT, CF, FFT, MG, IS LU, SP

■ Class W and A

■ $P = 8..32$

■ Target machine model

- $L = 27$, $BW = 80$, $B = \infty$

Jesus Labarta, SC,2002

System characterization

■ < 10% error regions

Jesus Labarta, SC,2002

Understanding architectures

Jesus Labarta, SC,2002

Understanding architectures

Jesus Labarta, SC,2002

Understanding applications (MPIRE)

■ 32 procs (no network contention)

All windows same scale

Jesus Labarta, SC,2002

Understanding applications (MPIRE)

■ Wide range parametric study for 32 CPUs (no network contention)

Jesus Labarta, SC,2002

Understanding applications (MPIRE)

■ Cluster of SMPs

- 4nodesx4, 1 link
- 128 p, L=25, BW=100, no network contention

Jesus Labarta, SC,2002

Conclusions

- **Paraver** and **Dimemas** are **powerful tools** to gain **deep insight** and understanding of program performance

■ Learning curve

- Slow start
- Pays off

■ cepbatools@cepba.upc.es

- Feedback welcome
- Support
